

ABSTRACT

A case that securely holds a handheld device and allows for charging the device while it is held in the case. The case includes a two-fold panel that folds on itself to form a cavity for receiving the handheld device. A device bracket for holding the handheld device is attached to a strap that is movably affixed to the inside of the case and holds the handheld device without covering the display and keypad areas. The portions of the case that cover the front and back surfaces of the handheld device fold back, away from the device bracket, thereby freeing up the end of the handheld device with the charging connector so that it may be inserted into a charging station.
